

Local Food Wastage Management System

1. Problem Statement

Food wastage is a major challenge in society, where restaurants, supermarkets, and individuals often dispose of surplus food while many people face food insecurity. The Local Food Wastage Management System aims to connect food providers with receivers through a centralized platform, reducing food waste and improving food distribution.

2. Business Use Cases

- Connect surplus food providers with NGOs and individuals in need.
- Reduce food wastage through efficient redistribution.
- Improve accessibility to available food resources.
- Analyze food donation and claim trends for better decision-making.
- Support sustainable food management practices.

3. Dataset Description

The project uses four datasets:

Providers Dataset

Contains details of food providers such as restaurants, supermarkets, and grocery stores.

Receivers Dataset

Contains details of NGOs, community centers, and individuals receiving food.

Food Listings Dataset

Contains information about available food items, quantity, location, food type, and meal type.

Claims Dataset

Contains details of food claims made by receivers and claim status.

4. Database Design

The SQL database consists of four tables:

- Providers
- Receivers
- Food_Listings
- Claims

Relationships:

- Providers provide food listings.
- Receivers claim food items.
- Claims table connects food listings and receivers.

5. Exploratory Data Analysis (EDA)

The dataset was analyzed to understand food donation patterns and food distribution trends.

Key Findings:

- Certain meal types contribute more food donations.
- Some provider categories donate significantly more food.
- A few locations contribute the highest food quantity.

6. SQL Query Outputs

Fifteen SQL queries were executed to analyze:

1. Total Food Available
2. Food Listings by Location
3. Food Type Distribution
4. Provider Type Contribution
5. Providers by City
6. Receivers by City
7. Providers Contact List
8. Top Receivers by Claims
9. Most Claimed Food Items
10. Providers with Successful Claims
11. Average Food Quantity

12. Meal Type Distribution
13. Top Providers by Food Donation
14. Top Locations by Food Quantity
15. Provider Type Performance

7. Streamlit Dashboard

The Streamlit application provides:

- Home Dashboard
- Providers Data
- Receivers Data
- Food Listings
- Filters
- SQL Dashboard
- Add Food
- Update Food
- Delete Food

8. Insights

- Food donations are concentrated in specific cities.
- Certain provider types contribute larger quantities of food.
- Some food categories are more frequently available.
- Receiver claim activity varies significantly across locations.
- Effective redistribution can substantially reduce food wastage.

9. Recommendations

- Encourage more restaurants and supermarkets to participate.
- Prioritize food distribution in high-demand locations.
- Implement automated notifications for newly available food.
- Improve tracking of food claims and completion rates.
- Expand the platform to additional cities and organizations.

10. Conclusion

The Local Food Wastage Management System successfully connects food providers and receivers through a centralized platform. The project demonstrates how SQL, Python, and Streamlit can be used to reduce food wastage, improve food accessibility, and generate valuable insights through data analysis.
